Introduction to Plate Tectonics

What Are Lithospheric Plates?

- The Earth's lithosphere is divided into large, rigid slabs called tectonic plates.
- These plates include both continental and oceanic crust.
- They vary in size and shape, covering the entire surface of the Earth.
- The plates are constantly moving, driven by Earth's internal heat.

Historical Development of Plate Tectonics Theory

- Early ideas of continental drift proposed by Alfred Wegener.
- The development of seafloor spreading hypotheses in the mid-20th century.
- The integration of these concepts into the modern theory of plate tectonics.

Mechanisms Driving Plate Movement

Plate Tectonics and Earth's Internal Heat

- Heat from Earth's interior causes convection currents within the semi-fluid asthenosphere.
- These convection currents create forces that move lithospheric plates.

- The heat source includes radioactive decay and residual heat from Earth's formation.

Types of Plate Movements

Common Questions and Answers from Prentice Hall Movement of Lithospheric Plates

Q1: What causes the movement of lithospheric plates?

- The primary cause is convection currents within the semi-fluid asthenosphere, which generate forces that push and pull plates. Additional forces such as ridge push and slab pull also contribute to plate motion.

Q2: How do scientists measure plate movements?

- Using GPS technology and satellite tracking, scientists measure the precise movement of plates over time. These measurements reveal that plates move at rates ranging from a few centimeters to

over ten centimeters per year.

Q3: Why do earthquakes frequently occur along plate boundaries?

- Earthquakes happen when stress builds up along fault lines at boundaries, and the accumulated energy is released suddenly. Most of these boundaries are zones of intense plate interaction.

Q4: What is the significance of magnetic striping on the ocean floor?

- Magnetic striping provides evidence for seafloor spreading and the symmetry of magnetic reversals, supporting the theory that new crust forms at divergent boundaries and moves outward.

Q5: How do subduction zones affect Earth's crust?

- Subduction zones lead to the recycling of oceanic crust into the mantle, contribute to volcanic activity, and generate deep earthquakes. They are also responsible for the formation of deep ocean trenches.
